Question 1

Answer saved

 Remove flag

Modern NLP systems often use "Pre-trained models". What are these?

- ☐ a. Models that have never seen data.
- ☒ b. Large language models trained on massive datasets that can be fine-tuned for specific tasks.
- ☐ c. Models that only work on rule-based systems.
- ☐ d. Hardware devices for text storage.

Question 3

Answer saved

 Remove flag

What is the primary purpose of "Stemming" in text preprocessing?

- ☐ a. To identify the part of speech of each word.
- ☒ b. To remove affixes and reduce a word to its base form, which might not be a dictionary word.
- ☐ c. To convert every word to its exact dictionary root.
- ☐ d. To remove punctuation from a sentence.

Question 4

Answer saved

 Remove flag

Why is "Ambiguity" considered the biggest challenge in NLP?

- ☐ a. Because machines have too much memory.
- ☒ b. Because a single sentence or word can have multiple meanings depending on context and intuition.
- ☐ c. Because humans talk too fast.
- ☐ d. Because there are too many languages in the world.

Question 5

Answer saved

 Remove flag

What does "Referring Expression Generation" do in an NLG system?

- ☐ a. It generates citations for the data used.
- ☒ b. It uses pronouns like "it" or "they" to maintain clarity and consistency.
- ☐ c. It translates the text into a different language.
- ☐ d. It checks the text for grammatical errors.

[Clear my choice](#)

Question 6

Answer saved

 Remove flag

What is the output of an NLU system?

- ☐ a. Human-friendly text
- ☒ b. Machine-readable meaning or intent
- ☐ c. A list of tokens only
- ☐ d. Binary code 0s and 1s

Question 12

Answer saved

Remove flag

Why do machines struggle with "Sarcasm and Irony"?

- ☐ a. Because sarcasm uses too many words.
- ☒ b. Because it requires deep contextual and social understanding that algorithms lack.
- ☐ c. Because sarcastic words are not in the dictionary.
- ☐ d. Because sarcasm is only used in spoken language.

Question 14

Answer saved

 Remove flag

What are "Stop Words" in NLP?

- ☐ a. Words that end a sentence.
- ☒ b. Common words like "is", "the", and "and" that are often removed to focus on meaningful terms.
- ☐ c. Rare words that are difficult for machines to translate.
- ☐ d. Words used to stop a program from running.

"Suffix stripping" is a technique primarily associated with:

- ☐ a. Lemmatization
- ☐ b. Sentence Tokenization
- ☒ c. Stemming
- ☐ d. Data Privacy

[Clear my choice](#)

Question 20

Answer saved

 Remove flag

Why is stop word removal detrimental to Text Summarization?

- ☐ a. It makes the file size too small.
- ☒ b. It removes essential grammatical relationships and meaning.
- ☐ c. It increases processing time.
- ☐ d. It makes the summary too long.

Question 31
Answer saved
Remove flag

Match the technique to its definition:_____

- A. Stemming: Removing affixes to reach a base form that may not be a valid dictionary word (e.g., "stript").
- B. Lemmatization: Reducing words to their base root form as found in a dictionary (e.g., "feet" to "foot").
- C. Case Folding: Converting all words to lowercase for uniform processing.

Read the 5 real-world business scenarios below. Determine which Natural Language Processing (NLP) task or application is required to solve each problem. **Drag and drop the correct NLP task from the options at the bottom into the corresponding blank box.**

- An HR department wants to deploy a system where employees can type questions like "How many days of paid leave do I get for maternity?" and the system directly extracts the exact answer from the company's internal employee handbook. The required NLP task is **Question Answering (QA)**.
- A real estate website wants a tool where real estate agents can input a few bullet points about a house (e.g., "3 bedrooms, big backyard, near school") and the system automatically writes a creative, fluent paragraph description for the listing. The required NLP task is **Text Generation**.
- A customer support center receives thousands of emails daily and wants to automatically sort them into specific folders like "Billing Issues," "Technical Bugs," or "General Inquiries" before human agents read them. The required NLP task is **Text Classification**.
- A story-writing assistant tool needs to track characters across a novel to ensure that when a sentence says "She gave him the book that her father bought," the system accurately knows who "She," "him," "that," and "her" refer to in the previous paragraph. The required NLP task is **Coreference Resolution**.
- An insurance company receives thousands of scanned, handwritten claim forms every day and needs to digitize the written text and map it directly into their database fields. The required information extraction task is **Information Extraction**.

Question 33
